

SYSTEM AND METHOD FOR CLIENT AWARE REQUEST DISPATCHING IN A
WIRELESS PORTAL SERVER

ABSTRACT OF THE INVENTION

5

A method for automatically configuring information display
in a client device. A user of a client device submits a request
for a resource to a portal server. Information in the request is
mapped to a unique identifier by the portal server. The unique
10 identifier is used by the portal server to select an aggregation
container that contains a display page with content that is
selected and formatted for the particular device associated with
the identifier. The user request is then dispatched to the
aggregation container, and the page specified by the container
15 is delivered to the requesting client device.
